cDNA. ETF is a previously unidentified T-cell growth factor which stimulates precursor or mature CD4+ and CD8+ T-lymphocytes to proliferate and differentiate. It also promotes proliferation of the gastrointestinal epithelium. The protein can be used to promote long term in vitro culture of T-lymphocytes and T-cell lines. ETF can be used for treating HIV infection, HIV-associated diseases, and other diseases or conditions where stimulation of T-cell proliferation would be desirable e.g., it could be used to augment the destruction of tumour cells or virallyinfected cells. ETF may also be used to treat or prevent gastrointestinal disease, including chemotherapy and radiotherapy associated enteritis,
                                                                                                                                                                                                                                                                                         CD4+;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents simian epithelium-derived T-cell factor (ETF)

```
IL-15 protein for use in screening for candidate drugs to treat diseases related to IL-15 activity. Genotyping or haplotyping an individual at the novel IL-15 activity. Genotyping or haplotyping an individual at the novel IL-15 polymorphic sites are useful for studying population.

diversity, anthropological lineage, the significance of diversity and inneage of the phenotypic level, paternity testing, forensic applications and for identifying associations between IL-15 genetic variation and a trait, such as level of drug response or susceptibility to disease.

Infections as sociation between a genotype or haplotype and a trait, is useful for developing diagnostic tests and therapeutic treatments for infections, human immundeficiency virus and T-cell iluxemia. The dentification of an association between a clinical response and a dentification of an association between a clinical response and a diagnostic method to determine those individuals who will or will not respond to the treatment, or alternatively, will respond at a lower level and thus may require more treatment, i.e. a greater dose of a drug. The genotyping or haplotyping methods are also useful for developing drugs targetting IL-15. The genotyping and haplotyping methods are also useful in designing clinical trials. IL-15 by expression of function of novel IL-15 isogene and also in gene therapy. Expression of an IL-15 isogene may be turned off by transforming the axpresses high levels of untranslatable mRNA for the isogene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Epithelium-derived T-cell factor; ETF; simian; human; enteritis; gastrointestinal disease; mucositis; peptic ulcer; cytostatic; villus atrophic disorder; inflammatory bowel disease; antiinflammatory; anti-HIV; antiviral; T-lymphocyte stimulator; ss.

The invention relates to simian and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and inflammatory bowel disease; for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The conditions where it is desired to stimulate proliferation of T-lymphocytes and B lymphocytes, or the secretion of immunoglobulin B T-lymphocytes to augment anti-infectious disease Immunity, to induce CTL, LMK or NK lytic activity, or to augment the destruction of tumour cells infected with virus. The present sequence represents a CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                             The present sequence describes an isolated RNA molecule which specifically cleaves mRNA encoding interleukin 15 (IL-15). The enzymatic RNA molecules can bind to and cleave mRNA encoding IL-15. They can be used for treating disorders associated with IL-15 such as inflammatory disorders, e.g. rheumatoid arthritis by inhibiting the synthesis of IL-15 in lymphocytes and preventing the recruitment and activation of macrophages. They can also be used to develop transgenic animals which can be used to identify the impact of increased or decreased IL-15 levels on a particular pathway or phenotype. The present sequence represents a human IL-15 DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      67 AGTCATTITCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGTGCAGGG 126

The present inventibon describes tow adenosine (A) content antisense coligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, cinan have respiratory. Pronchodilator, antiinflammatory, analgesic, the antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with expression and or activity of target polypeptides associated with activating peptide factors and malignancies, such as stimulating and activating peptide factors and tarasmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokine seceptors, adenosion molecules and their receptors, cytokine and chemokine receptors, adenosion molecules and their receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide receptors, offensins, growth factors, bradykinin receptors, receptors, defensins, growth factors, wasociated proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, allergies, pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary transplantation rejection, pulmonary infections, bronchitis, and antisense eligonucleotides may be used in the exemplification of fragments and antisense eligonucleotides is pulmonary infection, pulmonary insertion of fragments and antisense eligonucleotides used in the exemplification of the areasent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                               Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -

The invention relates to antisense oligonuclectides (AAA58045, AAA58047-AA58057) capable of inhibiting the expression of human interleukin-15 (TL-15) by Mybridising to IL-15 mRNN (AAA5804). IL-15 is a member of the short chain, 4 alpha helix bundle cytokine family and is a potent T-cell growth factor and activator. IL-15 acts as a stimulator of various T-cell mediated pathological immune responses, such as uctoimmune disorders (e.g., rheumatoid arthritis, graft versus host disease and organ transplant rejection), and has a proinflammatory role in rheumatoid arthritis synovitis. The antisense oligonucleotides are alleviating inflammatory prolyarthopathy associated with rheumatoid arthritis, organ transplant rejection (e.g., kidney transplant rejection, and are thus useful for alleviating inflammatory polyarthopathy associated with rheumatoid arthritis, organ transplant rejection (e.g., kidney transplant rejections, asthma, lupus erythematosus and inflammatory bowel disease. The present sequence represents a cDNA copy of human IL-15 mRNA.
                                                                                                                                 Human interleukin-15; IL-15; antisense therapy; expression inhibition; T-cell mediated immune response; autoimmune disorder; inflammatory polyarthropathy; rheumatoid arthritis; transplant rejection; graft versus host disease; lupus erythematosus; asthma; inflammatory bowel disease; gene therapy; immunosuppressive;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense oligomer useful for alleviating inflammatory polyarthopathy associated with organ and cell transplant rejection, inhibits production of interleukin-15 by hybridizing to its mRNA -
                                                                                                   Human interleukin-15 (IL-15) cDNA copy of mRNA.
AAA58044 standard; cDNA to mRNA; 1202 BP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RES & DEV.

```
tarigense oligonuclectide (NN) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The Own can have antiinflammatory, antiallergies, and/or inflammation. The Own can have antiinflammatory, antiallergies, and/or inflammatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impediated airways, including lung disease and diseases whose secondary effects affilict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, palm. cystic fibrosis, pulmonary hypertension, respiratory distress syndrome, paln, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONS break down with the conchoronstriction and inflammation. AAA32313 to AAA3312 represent the nucleotide sequences given in the sequence listing from the present the invention, which correspond to SEQ ID No:1 to 2815, but the sequences are also called SEQ ID No:1 to 185, but the sequences of differ from the previously named sequences. SEQ ID No:11 to 1680
                                                                                                                                                                                                                                                                                                                                                                                                                                                  antiallergic; antiasthmatic; cytostatic; analgesic; impaired airway; lung disease; ischaemic condition; pulmonary vasoconstriction; asthma; respiratory distress syndrome; pain; cystic fibrosis; emphysema; pulmonary hypertension; chronic obstructive pulmonary disease; COPD; cancer; leukaemia; lymphoma; carcinoma; metastasis; ss.

The products of the invention have anti-ILIS, anti-inflammatory, hepatotropic, anti-inflammatory and antiulcer activity and can be used for gene therapy. The antisense oligonucleotides are used to interleukin-15 (IL-15) expression and production, and prevent the recruitment and activation of macrophages. They are used to inhibit is recruitment and activation of macrophages. They are used to treat diseases associated with an increased expression of IL-15. Such diseases arithmatory disorders, such as inflammatory bowel diseases, arthritis, clirhosis, multiple sclerosis, chronic liver disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   IL-15; interleukin.15; human; anti-II15; anti-inflammatory; hepatotropic; anti-arthritic; neuroprotective; antiprollferative; antiulcer; antisense; gene therapy; macrophage; inflammatory disorder; boval disease; arthritis; cirrhosis; multiple sclerosis; chronic liver disease; ulcerative colitis; cell prollferative disorder; treatment; ss.
(AAA32323 to AAA33992) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence listing.

     þe
in vivo or ex vivo. The antisense oligonucleotides of the invention are specific for interleukin-15 (IL-15), and can be delivered exogenously or can be expressed from DNA or RNA vectors. This sequence encodes the human IL-15 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; respiratory distress syndrome; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base.

(I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonaclectides and (I) can be used to down-regulate the expression and or activity of target polypetides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprisaing them. In the antisense oligonucleotides and compositions (I) comprisaing them. In the antisense (I) can have respiratory, bronchodilator, antifilammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lungivespiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibododes, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central chemokine system (OKS) and peripheral nervous and non-nervous system contrains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          receptors, ONS and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and transmitters, defensins, growth factors, vasoactive peptides and antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergy(les) and/or bronchoconstriction) and/or lung inflammation, allergy(les) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation.

Condition selected from pulmonary vasoconstriction, inflammation, hypertension, emphysema, chronic obstructive pulmonary distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary distress syndrome conformation rejection, pulmonary disconser, AAPL8434 to AAPL813 represent human polynucleotide and/or cancer. AAPL8434 to AAPL813 represent human polynucleotide in the exemplification of

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleals acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, and/or inflammation. The ON can have antiinflammatory, antiallergic, and/or inflammation. The ON can have antiinflammatory, antiallergic, antialsthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, sathma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasists to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of decyydenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence of the present invention. ABA32231 to append to the present invention of the sequence listing.

The invention relates to antisense compounds that are targeted to a 5' or 3' untranslated region (5'0TR or 3'0TR) of a nucleic acid molecule encoding human interleukin-15 (IL-15), and inhibit the expression of human IL-15. The antisense inhibitors are is useful for inhibiting expression of IL-15 in human cells or tissues in vitro, for treating humans or other animals suspected for having or being prone to a disease associated with IL-15 expression, e.g. infleations, inflammation or tumours. The inhibitors can also be used for research or diagnostic purposes. Using antisense compounds specifically and effectively inhibits IL-15 function.
                                                                                                                                                                                           Interleukin-15; IL-15; antisense inhibitor; untranslated region; 5'UTR; 3'UTR; human; infection; inflammation; tumour; therapy; diagnosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense compound useful for inhibiting human interleukin-15 expression useful for treating diseases associated with interleukin-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

cancers

targets nucleic acids inventions a new composition comprising an tartisense oligonuclectide (NN) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, cantiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impedired airways, including lung diseases and diseases whose secondary e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic pulmonary hypertension, emphysema, chronic obstructive pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONS break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present libs sequences are also called SEO ID No: 1 to 185, but the sequences differ from the previously named sequences. SEO ID No: 1 to 1680 (AAA33233 to AAA33922) are specifically claimed ONs from the present invention. When we will the their corresponding SEQ ID No: sequences given in the disclosure of the present invention and not match up with their corresponding SEQ ID No: sequences The present invention describes a new composition comprising an

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstriction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

Disclosure; Page 1264; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which inflammation cacids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antinflammatory, antiallergic, antialsthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects affilict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive

```
;
pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, arctinomas, and cancers which may metastasise to the lungs, including breaxt and prostate cancer. The reduction of the adenosine content of the ONS reduces side effects. The A-containing ONS break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA3213 to AAA3512 represent invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1880 (AAA33233 to AAA3392) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     - which

                                                                                                                                                                                                                                                                                                                                                               δ
   ö
A simian species of IL-15 (sIL-15) was purified and its AA sequence analysed (see AAR83309, AAR83436, AAT00524, AAT00524, AAT00525). Both the simian and the human ORFS encode a precursor polypeptide (AAR83436, AAR83438). The precursor polypeptide (AAR83436, ABR8438). The precursor polypeptide (AAR83436, ABR8438). The active encoding mature simian or human IL-15 polypeptides are disclosed in AAR8330 & AAR83310 respectively. The invention also comprises other mammalian IL-15, including human IL-15, that hybridise to probes defined by AAR83438. A plasmid contg. a recombinant clone of human IL-15 con was deposited with ATCC on Feb. 19 1993 under ATCC 69245. The deposit was named 141-hETF. AAR83451 is a mammalian mature IL-15 polypeptide. It is a generic sequence which encompasses both AAR83309 (simian) and AAR83310 (human) IL-15 mature polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antibodies that specifically binds epithelium-derived T-cell factor polypeptide useful for e.g. treating or preventing gastrointestinal

                                                                                                                                                                        The invention relates to simian and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF diseases, such as chemotherapy and radiation therapy-induced enterits and mucositis, peptic ulcer disease, villus atrophic disorders and inflammancy bowel disease; for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The antibodies are further used to treat a variety of other diseases or conditions where it is desired to stimulate proliferation of T-lymphocytes and B lymphocytes, or the secretion of immorplobulin B lymphocytes, to augment anti-infectious disease immunity, to induce CTL, LAK or NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; businfactant depletion; respiratory; bronchodilator; antifilammatory; immunosuppressive; antiasthmatic; analgasic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;

The present invention describes low acenosise (4) content antisense oligonucleotides and compositions (1) comprising them. In the antisense cligonucleotides the A is replaced by a 'Universal' or alternative base. (1) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antisthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (1) can be used to down-regulate the cytosasion and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and cutivating peptide factors and transmitters, transcription factors, continuating peptide factors and malignancies, such as stimulating and chemokines, endogenously produced specific and non-specific enzymes, chemokines, endogenously produced specific and non-specific enzymes, chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creceptors. As adenosine receptors, vasoactive peptides and receptors, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The condition selected from pulmonary associated with a disease or including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergies, asthma, impeded respiratory vasoconstriction) and/or lung inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (C RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary pulmonary transplantation rejection, pulmonary infections, bronchitis, character invention ceptorion, pulmonary infections, bronchitis, character invention.
                                                      Low adenosine (A) content antisense oligonucleotides which do not
trigger adenosine receptors during metabolism, useful e.g. for treating
cancers and respiratory obstructions -
                                                                                                                                                                                                                       invention describes low adenosine (A) content antisense
                                                                                                                                                           Disclosure; Page 1345-1348; 1592pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, compositions are useful for the treatment of diseases associated with inflammation. The ON can have antiinflammatory, antiallergic, cuseful for the treatment of diseases associated with inflammation, angular adjacent of diseases associated with inflammation, caffict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating estyma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of decyydenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA33313 to AAA33312 represent the nuclectide sequences given in the sequence listing from the present incredition and inflammation. AAA33313 to AAA33312 represent the lifer from the previously named sequences. SED ID NO: 11 to 1885, and then the last invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SED ID NO: sequences given in the sequence listing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó

The present sequence is human interleukin-15 (IL-15) gene allele located on chromosome 4q31. The polymorphic variants of IL-15 genes are useful for studying the expression and function of IL-15 and expressing to concluding the expression and function of IL-15 and expressing to IL-15 protein for screening for candidate drugs to IL-15 protein drugs of the novel IL-15 polymorphic sites are useful for studying conjudical allineage of the phenotypic level, paternity testing, conversity and lineage of the phenotypic level, paternity testing, conversity and lineage of the phenotypic level, paternity testing, conversity and a trait such as level of drug response or susceptibility to disease. Identifying association between a genotype or haplotype and a trait, is useful for developing diagnosit tests and therapeutic treatments for infections, human immunodeficiancy virus and therapeutic treatments for infections, human immunodeficiancy virus and therapeutic treatments for infections, human immunodeficiancy virus and therapeutic agencyppe or haplotype of an association between a clinical respond at a parent pagnostic method to determine those individuals who will or will not respond to the treatment, i.e. a greater dose of a drug. The genotyping and haplotyping methods are also useful for developing drugs taggetting IL-15 The genotyping and haplotyping methods are also useful for therapeutic purposes for treating crisarders affected by expression of function of novel IL-15 sogene and elso in gene therapy. Expression of function of novel IL-15 sogene may be turned off by transforming a targetted organ, tissue or cell population of an IL-15 sogene may be turned off the concept to the pagnose or cell population of an IL-15 sockers of a socker or cell population of an IL-15 sockers or cell population of an IL-15 sockers or cell population of an IL-15 sockers or cell populati
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotides comprising one of 11, PSI-PS11, single nucleotide polymorphisms in human interleukin-15 gene, and useful for treating disorders affected by expression of function of interleukin-15 isogene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

for studying the expression and function of IL-15 and expressing

C IL-15 protein for use in useful for screening for candidate drugs to

treat diseases related to IL-15 activity. Genotyping or haplotyping an

individual at the novel IL-15 polymorphic sites are useful for studying

c diversity and lineage of the phenotypic level, patentity testing,

c diversity and lineage of the phenotypic level, patentity testing,

c forensic applications and for identifying associations between IL-15

genetic variation and a trait such as level of drug response or

cs usceptibility to disease. Identifying an association between a genotype

cor haplotype and a trait, is useful for developing diagnostic tests and

therapeutic treatments for infections, human immunodeficiency virus and

cor haplotype and a genotype or haplotype (or haplotype pair) for the IL-15

gene may be the basis for designing a diagnostic method to determine

c response and a genotype or haplotype (or haplotype pair) for the IL-15

gene may be the basis for designing a diagnostic method to determine

those individuals who will or will not respond to the treatment, or

alternatively, will respond at a lower level and thus may require more

treatment, i.e. a greater dose of a drug. The genotyping or haplotyping

methods are also useful for therapeutic purposes for treating

c methods are also useful for therapeutic purposes for treating

trials. IL-15 DNA is useful for therapeutic purposes for treating

c disorders affected by expression of function of novel IL-15 isogene and

c also in gene therapy. Expression of an IL-15 isogene may be turned off

by transforming a targetted organ, tissue or cell population of an

c parenesses high levels of untranslatable mRNA for

the solution weeter that expresses high levels of untranslatable mRNA for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is affilicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast calls. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

nucleic acids, targeted to interleukin-15 (IL-15). The products of the
invention have anti-inflammatory, hepatotropic,
anti-arthritic, neuroprotective, antiproliferative and antiulcer activity
and can be used for gene therapy. The antisense oligonucleotides are used
to inhibit interleukin-15 (IL-15) expression and production, and prevent
the recruitment and activation of macrophages. They are used to treat
diseases associated with an increased expression of IL-15. Such diseases
include inflammatory disorders, such as inflammatory bowel disease,
arthritis, cirrhosis, multiple sclerosis, chronic liver disease,
culcerative colitis and cell proliferative disorders. The treatment may
be in vivo or ex vivo. The antisense oligonucleotides of the invention
exogenously or can be expressed from DNA or RNA vectors. AA288709
represent the antisense ligonucleotides disclosed in the method of the

invention have anti-Lis, anti-inflammatory, hepatotropic, invention have anti-Lis, anti-inflammatory, hepatotropic, anti-inflammatory, hepatotropic, anti-inflammatory, hepatotropic, anti-inflammatory, hepatotropic, and can be used for gene therapy. The antisense oligonucleotides are used to inhibit interleukin-15 (IL-15) expression and production, and prevent the recruitment and activation of macrophages. They are used to treat diseases associated with an increased expression of IL-15. Such diseases architis, cirrhosis, multiple sclerosis, chronic liver disease, ulcerative colitis and cell proliferative disorders. The treatment may be in vivo or ex vivo. The antisense oligonucleotides of the invention exogenously or can be expressed from DNA or RNA vectors. ASSB709-288723 represent the antisense ligonucleotides distless method of the
